FUNCTION: PRODUCTION OF EXTRACELLULAR GLUCANS, THAT ARE THOUGHT TO PLAY A KEY ROLE IN THE DEVELOPMENT OF THE DENTAL PLAQUE BECAN OF THEIR ABILITY TO ADHERE TO SMOOTH SURFACES AND MEDIATE THE AGGREGATION OF BACTERIAL CELLS AND FOOD DEBRIS.

CATALYTIC ACTIVITY: SUCROSE + (1,6-ALPHA-D-GLUCOSYL)(N) = D-FRUCTOSE + (1,6-ALPHA-D-GLUCOSYL)(N+1).
                                                                                                                                                                                                        GLUCANS.
SIMILARITY: TO OTHER GLUCOSYLTRANSFERASES
BINDING PROTEIN FROM S.MUTANS.

"Analysis of the Streptococcus downed gtfs gene, which specifies a glucosyltransferase that synthesizes soluble glucans.";

INTECT. IMMUN. 58:2452-2458(1990).

-I- FUNCTION: PRODUCTION OF EXTRACELLULAR GLUCANS, THAT ARE THOUGHT FUNCTION: PRODUCTION OF EXTRACELLULAR GLUCANS, THAT ARE THOUGHT OF LAY A KEY ROLE IN THE DEVELOPMENT OF THE BUNTAL PLAQUE BECAUSE OF THEIR ABILITY TO ADHERE TO SMOOTH SURFACES AND MEDIATE THE AGGREGATION OF BACTERIAL CELLS AND FOOD DEBRIS.

-I- CATALYTIC ACTIVITY: SUCROSE + (1,6 ALPHA-D-GLUCOSYL)(N) -

D-FRUCTOSE + (1,6-ALPHA-D-GLUCOSYL)(N+1).

-I- ENZYME REGULATION: GLUCAN SYNTHESIS BY GTF-S IS INDEPENDENT OF PRIMER GLUCAN UNLIKE GTF-I.

"A common one gene sequence transduced by avian carcinoma virus MH2
and by murine sarcoma virus 3611.";

SCIENCE 223:813-816(1984).

-I- DISEASE: BY ITSELF THE V-MIL ONCOGENE HAS ONLY WEAK TRANSFORMING
CAPACITY BUT IT ABOLLSHES THE GROWTH FACTOR REQUIREMENTS OF AVIAN
MACROPHAGES TRANSFORMED BY OTHER ONCOGENES.

-I- THIS PROTEIN IS SYNTHESIZED AS A GAG-MHT OR GAG-MIL POLYPROTEIN.

SIMILARITY: WITH THE CONSERVED CATALYTIC DOMAINS OF SER/THR-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    21-JUL-1986 (REL. 01, CREATED)

Statistics: Mean 29.032; Variance 42.944; scale 0.676

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Tue Jan 11 15:36:55 2000; MasPar time 3.63 Seconds 232.086 Million cell updates/sec

ar output not generated.

Description: Perfect Score: Sequence: Title: >US-09-290-049-1 (1-21) from US09290049.pep 148

1 ANDHLSILEAWSDNDTPYLHD 21

Scoring table: PAM 150 Gap 15

Searched: 122810 seqs, 40068593 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

pir60 1:pir1 2:pir2 3:pir3 4:pir4

Statistics: Mean 28.783; Variance 46.009; scale 0.626

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 20.775; Variance 64.431; scale 0.322

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

glucosyltransferase in a mammal. The immune response results in reduction of the colonisation or accumulation of mutans streptococcal strains in the mammal. Compositions containing W34156 specifically interfere with the glucan-binding activity of the streptococcal glucosyltransferase. The peptides can also be used in vaccines for preventing dental caries in mammals. Sequence 22 AA;	one or more of these sequences linked to a lystne core matrix (see W34161-W34165). A composition comprising one of these sequences can be administered to a mammal to raise an immune response, in a method for interfering with the enzymatic activity of streptococcal	W34156-W34160 represent immunogenic fragments of the Streptomyces mutans glucosyltransferase (GTF) enzyme. W34157 and W34158 are from the catalytic domain of GTF, while W34160 is from the GTF surface domain. W34156 and W34159 are from the glucan-binding domain of GTF. These sequences can all be used in the immunogenic composition of the	11-NOV-1997. 01-MAY-1992; 877295. 30-APR-1993; US-057162. 30-APR-1993; US-877295. 01-MAY-1992; US-877295. (FORS-) FORSYTH DENTAL INFIRMARY FOR CHILDREN. Smith DJ, Taubman MA; WPI; 97-558089/51. Immunogenic compositions containing streptococcal glucosyl:transferase peptide(s) - used for provoking immune response to streptococcal glucosyl:transferase for preventing dental caries	HT 1 W34159; W34159; 18-FEB-1998 (first entry) 18-FEB-1998 (pry tentry) GTF antigenic peptide #4. Glucosyltransferase; GTF; enzyme; immunogen; catalytic domain; vaccine; surface domain; glucan-binding domain; mutans streptococcal strain; immune response; glucan-binding activity; dental caries prevention. Streptococcus mutans. US5686075-A.

The sequences (R43594-98) are subsequences from GT, they provoke T- and B-cell responses in mammals. The can be used to produce a vaccine comprising 2 of these sequences attached to a peptidyl core matrix. They are useful in producing T-cell responses to the GT enzyme causing a reduction of colonisation or accumulation of mutans steptococcal strains in mammals. The vaccines can be use

CW 33461-734465 represent the Streptomyces mutans glycosyltransferase (GTF) CC w3461-734165 represent the Streptomyces mutans glycosyltransferase (GTF) CC enzyme immunogenic fragments shown in W34156-W34160 linked to a polylysine core. W34157 and W34158 are from the catalytic domain of GTF, while W34160 is from the GTF surface domain. W34156 and W34159 are from the glucan-binding domain of GTF. These sequences, and the immunogenic composition of the invention. A composition composition of the invention. A composition composition of the invention composition or a method for interfering with the enzymatic activity of streptococcal glucosyltransferase in a mammal. The immune response results in reduction of the colonisation or accumulation of mutans streptococcal strains in the mammal. Compositions containing W34156 specifically interfere with the streptococcal glucosyltransferase.

                                                                                                                                                     Claim 13; Page 15; 29pp; Japanese.

Claim 13; Page 15; 29pp; Japanese.

The DNA sequence from Streptococcus sobrinus strain 6715 encodes glucosyltransferase-I (and mutants). The DNA was obtd. by treating slucosyltransferase-I (and mutanolysin, extracting the chromosomal DNA, partially digesting with SauJAI and fractionating on agazose gel. The 3-5 kbp fragment was ligated into pUC18 and E. coli JM109 transformed with it. A GT-1 expressing clone was isolated and sequenced. The clone may be used in the development of a drug for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence represents an alpha-D-glucosyltransferase from Streptococcus salivarius. The enzyme is primer-independent, and produces soluble glucan from sucrose. A gene encoding the enzyme may be cloned and expressed in Escherichia coli using a subclone of phage lambda-Cl3, e.g. plasmid pGSG501 or plasmid pGSG502. The DNA may also be expressed in a transgenic plant, to improve the level of stored carbohydrate in a pasture plant which normally contains low levels, or to prevent degradation of stored carbohydrate during plant senescence. Dextran may be isolated from the plant, for use as a food binder or pharmaceutical additive. Primer independence ensures that the enzyme will be functional in plants. The glucan is poorly degraded in plants but easily degraded by bacteria in the rumen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1533 tgqqvingkqlyfdgsgrqvkg

A protein (R95017) comprising amino acids 1873-2684 of Clostridium difficile VPI strain 10463 toxin A (see also R95016) was obtd. by PCR amplification of genomic DNA. The PCR product can be expressed in transformed E. coli host cells as a soluble fusion protein, with maltose binding protein or a polyhistidine affinity tag as fusion partner. The resulting soluble fusion proteins, which are substantially endotoxin-free, can be used in anti-clostridial vaccines or to raise avian antibodies useful in clostridial antitoxi therapy for humans and animals.

This is the amino acid sequence of Clostridium difficile toxin A, deduced from the coding region (see v90560) of the toxin A gene. Toxin A is a potent cytotoxin that plays a direct role in damaging gastrointestinal tissues. Severe cases of C. difficile intoxication result in pseudomembranous colitis. This would be prevented by neutralising the effects of toxin A in the gastrointestinal tract. Examples are provided of the production of recombinant C. difficile toxin A in host cells and of the in toxin A polypeptides. The invention specifically relates to recombinant proteins derived from Clostridium botulinum toxins (see W68389-400) and their use as immunogens for the production of

Claim 63; Page 290-302; 434pp; English.
Clostridium difficile VPI strain 10463 toxin A (R95016), the
product of the toxin A gene (T2928), is a potent cytotoxin that
plays a direct role in damaging gastrointestinal tissues and is
associated with diarrhoetic disease. It can be obtd. by expression in
transformed E. coli hosts of portions of DNA that together cover the
entire toxin A gene. Toxin A, and portions of it (see also
R95014-15 and R95017), pref. expressed as fusions to polyhistidine
affinity tags or maltose binding protein, are used to raise avian
antibodies useful as antitoxins or diagnostics, and in vaccine prodn.

Claim 12; Page 327; 483pp; English.

This sequence represents a Streptococcus pneumoniae protein that, based con homology with Bacteroides nodosus protein, is a peptide chain release factor 3 (RF-3), and is encoded by a DNA sequence of the invention.

CC The DNA sequences were isolated from Streptococcus pneumoniae strain CC 0100933 (NCIMB 40794). The Streptococcus pneumoniae proteins of the CC invention can be used to identify compounds which interact with and CC inhibit or activate the activity of the proteins. Antagonists can be used to treat diseases caused by S. pneumoniae proteins or through genetic cin a mammal by inoculation with the S. pneumoniae proteins or delivery CC of the encoding nucleic acids in a vector adequate to produce antibody CC and/or T cell immune responses to protect the animal from disease. The CC capable of inhibiting their bloactivity. In particular the proteins of the invention can be used to identify antimicrobial compounds which are CC capable of inhibiting their bloactivity. In particular the proteins of the invention can be used to prevent adhesion of bacteria to mammalian cell invention of bacteria to mammalian cell invention of pathogenesis in infections initiated other than by the implantation of in-dwelling devices or other surgical techniques.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cpk murine model of a polycystic kidney disease (PKD), and has decreased expression following acute renal injury. PKD is a common disease (affecting 1 in 500-1000 individuals) and can be inherited as an autosomal dominant or as an autosomal recessive. PKD is characterised by the development of innumerable, large, fluid-filled cysts from the nephrons and collecting ducts of affected kidneys. It is thought that enlargement of the cysts interferes with functioning of the normal renal parenchyma, which eventually leads to renal failure. The mPRP, or other similar mammalian PRPs can be used as diagnostic markers for PKD and acute renal failure. The PRPs can also be used in therapeutic and protective treatments, such as for acute organophosphate toxicity. They can also be used to develop products to enhance the effectiveness of other types of therapy, e.g. phosphottiesterase inhibitors to enhance the effectiveness of certain anti-cancer, or anti-HIV drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S. pneumoniae peptide châin release factor 3 (RF-3). Streptococcus pneumoniae protein; genetic immunisation; antiagonist; immunological response; inoculation; antibody production; inhibitor; T cell immune response; antimicrobial compound; bacterial adhesion; extracellular matrix protein; protein-mediated cell invasion; wound;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel Streptococcus pneumoniae diagnosing anti-microbial agent
